Synchronous operation of up to four MP1800A units generates 32G × 32ch (32G PPG module) and 64G × 16ch (64G MUX) signals.

Synchronization up to 8ch

Due to the modular platform design, the PPG/ED modules can be configured with various other modules to configure custom systems. The number of channels per 28G/32G PPG/ED module can be selected from 1, 2, or 4 and PPG/ED modules can be installed to support up to 8ch. Moreover, since each channel pattern can be synchronized, D/A converters, MUX/DEMUX, crosstalk, and skew tolerance can be evaluated.
∗: For details about possible module combinations, see the Option Selection Guide for the MP1800A series.

High Sensitivity Error Detector (ED)

MU183040B/MU183041B 28 G/32 Gbit/s High Sensitivity ED extends the performance of the earlier A-type ED to offer world's best Rx sensitivity∗ with the world's fastest Auto Adjust∗ (auto-align of threshold level and phase points).
The MU183040B/41B supports simultaneous multichannel measurements of low-amplitude, low Eye Opening DUTs such as Highs Speed Back Plane devices and Active Optical Cable (AOC) to achieve more-accurate, ideal signal quality analysis.

Eye Amplitude Sensitivity:
15 mVp-p (typ.) (28.1 Gbit/s, Single-end)
≤25 mVp-p (28.1 Gbit/s, Single-end)
Eye Height Sensitivity:
10 mVp-p (typ.) (28.1 Gbit/s, Single-end)

∗As of September, 2013

Passive Equalizer

In high speed serial transmission such as 28 Gbit/s, transmission losses of printed-circuits boards causes the Eye Opening to become narrower.
The J1621A and J1622A Passive Linear Equalizers can be connected to the ED to compensate for PCB trace losses and improve the Eye Opening. Combination with the MU183040B/MU183041B High Sensitivity ED supports Jitter Tolerance tests of PHY devices with a narrow Eye Opening.
Low-jitter, High-quality Waveform

The PPG module supports low-jitter and high-quality waveforms. The output amplitude can be customized to application needs.
Low-jitter: RJ 300 fs rms (typ.)
Total RMS Jitter 700 fs rms (typ.)
High amplitude: 0.5 Vp-p to 3.5 Vp-p

Clock Recovery

Internal Clock Recovery option can be installed in to MU183040B/41B. Physical layer (PHY) devices, such as SERDES, sometimes have different Tx and Rx Clock systems and Clock Recovery is required at the Error Detector for jitter tolerance tests. Additionally, since transmission using Multi-Mode Fiber (MMF) causes generation of jitter and wander components in the Rx module, Clock Recovery at the Error Detector is similarly required.
Installing this Clock Recovery option supports stress jitter tolerance tests of PHY devices with different Tx and Rx clocks, BER measurements of AOC devices, and simultaneous multichannel measurements, offering even more accurate and ideal signal integrity analyses.

SJ, RJ, BUJ, SSC and Half Period Jitter (F/2 Jitter) Generation

The MU181500B Jitter Modulator generates wide-amplitude SJ up to 1 UI at a Jitter Frequency of 250 MHz and a maximum 2000UI, ensuring sufficient margin for receiver Jitter Tolerance tests. Additionally, the Intrinsic Jitter of 275 fs rms (nominal)* is extremely low, not only when Jitter modulation is OFF but also when 0 UI is set at Jitter modulation ON, ensuring accurate measurements even at low Jitter amplitudes. The combination of low intrinsic jitter waveform with excellent jitter transparency supports high-accuracy Jitter Tolerance tests. Moreover, simultaneous injection of RJ, BUJ and SSC as well as dual SJ for two-tone supports various Jitter Tolerance tests. Additionally, the MX181500A Jitter/Noise Tolerance Test Software supports multi-mask tables as well as easy mask editing to support next-generation standards.

4PAM/8PAM Signal Generation

Combining the Anritsu MZ1834A/MZ1838A 4/8 PAM Converter with the MP1800A Signal Quality Analyzer supports generation of both 4PAM and 8PAM signals for R&D High Speed Back Plane and 400 GbE R&D. The MP1800A high-quality NRZ waveform and wideband passive PAM converter generate high-quality PAM signals with assured S/N.

True BER Measurement of 32Gbaud 4PAM Signal

BER measurement of 4PAM signals requires accurate measurement of bit error rates in each of three Eye patterns using a 3-ch Error Detector (ED). However, each Eye data pattern must be a programmable pattern due to differences in regular PRBS. Moreover, since 2-bit data is split between three Eye patterns, errors may be counted twice by mistake at simple error measurements for each Eye, so the true BER cannot be measured.
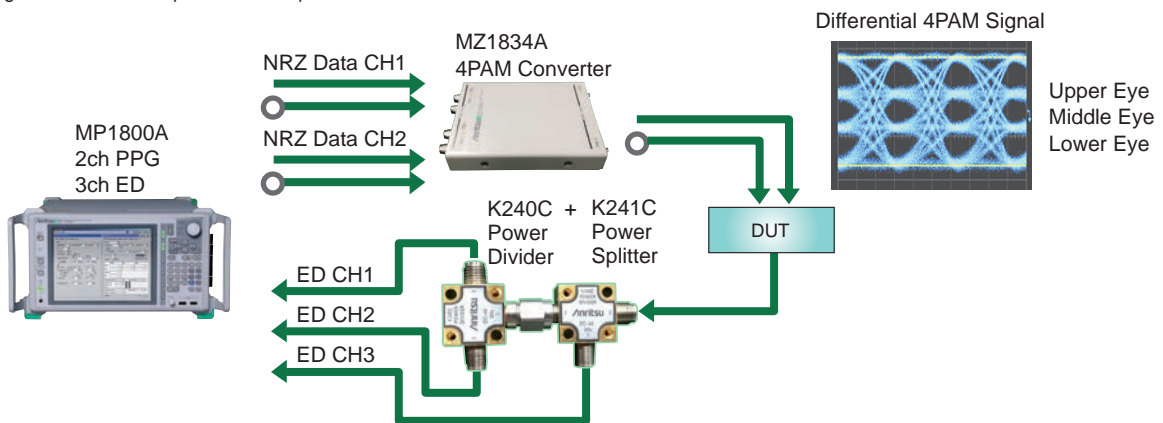

The BER of the three Eye patterns of a 4PAM data signal can be measured simultaneously by combining the K240C Power Divider and K241C Power Splitter with the MU18304xB High-Sensitivity ED. Additionally, the True BER of 4PAM signals can be measured using both the MP1800A long-memory programmable pattern function and the error mask function for removing unwanted errors.

Moreover, versatile automatic measurement functions∗ enable easy and efficient testing.

- Auto Search function automatically detects each decision point (both the amplitude and phase) of Upper, Middle and Lower Eye.
- Simultaneous Bathtub Jitter measurement for PAM 3Eyes
- Eye Margin, Eye Diagram and Q-value measurement

∗: MP1800A Software Version 7.9 or later.
   Eye Height >50 mV at the input of ED is required for 4PAM automatic measurement function.

Low-jitter High-quality Waveforms

The combination of low-jitter, high-quality output waveform, and high-amplitude output PPG modules can be tailored to the application.
• Low Jitter: 8 ps p-p (MU181020B-012)
• High Amplitude: 0.5 Vp-p to 3.5 Vp-p (MU181020B-013)

Versatile Pattern Generation

• Pseudorandom patterns (PRBS)
 Because all PRBS rates required by the standards are supported up to PRBS$2^{31} - 1$, all BER are supported.
  $2^n - 1$ (n = 7, 9, 10, 11, 15, 20, 23, 31)
• Zero Substitution Pattern
 All 0s and All 1s patterns can be added to PRBS patterns for performing CDR tolerance tests.
  2^n, $2^n - 1$ (n = 7, 9, 10, 11, 15, 20, 23)
• Data Pattern
 Patterns required by each application can be created with flexibility.
  128 Mbits max. (Steps: 1-bit)
• Alternate Pattern
 Two patterns (A and B) can be set and the A/B pattern can be output at any timing.
• Mixed Pattern
 A mixed data and PRBS pattern can be output. At creation of SONET/SDH frames, adding a PRBS$2^{31} - 1$, etc., pattern to the payload allows setting of a continuous pattern across frames.
• Sequence Pattern
 A variety of programmable patterns can be output in any sequence and combining various patterns offers effective support for applications requiring sequence processing.
